

Read what growers have to say about their experience with TEPERA® PLUS Fungicide+Insecticide and TEPERA Fungicide

“ I have already recommended TEPERA PLUS Fungicide+Insecticide and TEPERA Fungicide to others. I have been impressed, so I told them how well it mixed and spread on fields.”

- Shamus Currans, Graettinger, IA

“ I saw about a 3-5 bushel increase in yield in the field treated with TEPERA PLUS Fungicide+Insecticide. Plant health was good and standability was excellent at harvest. There were no problems with compatibility in the tank. I am planning to treat 50 percent of my corn acres with TEPERA PLUS next year.”

- George Elfering, Bird Island, MN

“ We treated all of our corn acres with TEPERA PLUS Fungicide+Insecticide. The corn did really well. On average, we saw a 10-15 bushel yield increase. We had four days of 40 mph winds, and the TEPERA PLUS treated corn hung onto the ear well and had good plant health. The ear didn't fall out of the husk. Some neighbors who didn't treat had 50 bushels of corn per acre on the ground due to the winds.”

- Brad Eppenbach, Ord, NE

“ I chose to apply TEPERA PLUS Fungicide+Insecticide on my corn and soybeans for early cold season protection of the seed and the products were easy to handle. Excellent plant stand on both corn and beans. TEPERA PLUS has a very good ROI.”

- Mike Jaeger, Charles City, IA

“ TEPERA PLUS Fungicide+Insecticide applied to corn performs well – it mixes well and is an easy product to handle. I'm experiencing superior plant health with TEPERA PLUS and I'm very pleased as of early October, 2017.”

- Jason May, Rush City, MN, Jason May Family Farms

“ The TEPERA PLUS Fungicide+Insecticide treated corn acres looked visually better throughout the entire year. Looking at the yield map I have a defined line of treated versus untreated acres. The standability of TEPERA PLUS treated corn was excellent all year long. Where corn wasn't treated we noticed the tops of corn plants were tipped over. Treated corn remained intact, and stood up to the wind better. Overall, we had a 7-10 bushel increase in yield on our corn acres treated with TEPERA PLUS. Our biggest advantage was in areas that were not productive at all last year, as well as areas with compaction and water issues.”

- Nathan Spiekermeier, Sheldon, ND

“ When I drove past fields after the TEPERA PLUS applied corn had emerged, I noted a quick emergence and even germination. The greatest visual difference however, was a better plant stand on the TEPERA PLUS corn applied fields versus non-applied field.”

- Eric Trittin, Lidgerwood, ND
